

## Central Everglades Planning Project Configuration Summary Sheet

**Configuration Name:** Establish a Unique and Descriptive Name of the Proposed Configuration.

Future Heritage Model

**Author of the Configuration:** Identify the name of the Author that developed the Configuration during the exercise.

Marshall Jones

**Configuration's General Description:** This description should be able to convey the general aspects, elements, and general location of management measures in this configuration.

This configuration is incomplete. We must continue to work together and leave in place structures required for flood control and implement new changes necessary to face E-ND required water. This model is also to insure the health of landscape & wildlife for our future generations.

**Management Measures:** List the management measures used in the configuration (Pump Stations, Spreader Canals, Canal Plugs and Backfill).

Spreader Canal along 6th St., 200' plugs in Miami Canal up to 2000'. Berms to direct sheet flow, levee removal along Miami Canal North of L-67 S.; Place water control structures along South WCA 3-B L-67, New Levee in 3-B,

**How Water Flows Through the Configuration:** This description should identify the travel route of the water that the configuration will be managing. Identify where the water is coming from and where it goes. The Author should be able to generally describe how the water gets from the originating water source (for example, from EAA Storage and Treatment to Florida Bay) to the final destination of the water.

The sheetflow would be near historical.

**Objectives:** Identify and prioritize (rank) the specific CEPP Objectives that the configuration is intended to meet (use the list of Objectives as needed).

- A) Plugs in Miami canal w/ header bypass + Diversion levees
- B) Operational changes w/ spreader canal along L-T (no more than 3' diff)
- C) Levee removed along length of Miami canal North of L-67C  
"demucked"
- D) Place WCS along Southern L-67A and backfill Southern L-67C and implement a new levee to direct water past L-69 & into E.NP
- E) Implement New Pump stations along East buffer of WCS to feed water when needed due to ocean.

**Anticipated Benefits General Description:** Identify why the Author chose the features in the configuration. List, prioritize and provide a general description of any benefits anticipated from the Proposed Configuration.

These changes will improve sheetflow ; allow for continued flood control,  
control ; feed ENP needed water with control.  
They will be cost effective and utilize Natures gravitational force

**Operating Assumptions General Description:** List anything specifically that the Author wants relative to the operation of the configuration. Examples might be operational changes within Water Conservation Area 3, areas to focus pulse discharges or timing modifications to natural system.

Allow stream monitoring no determine distribution & timing.  
Choosing source Pump Stations & Control Structures to  
function of Conservation area and allowing major  
Street flooding without staff.

**Other Key Elements:** List the main Considerations that have not been mentioned elsewhere on this Form. Examples may include potential Recreational Opportunities or Concerns.

Do not flood Mack's fire camp (3rd flt)  
Please coordinate with Marshall Jones 234-336-1123  
prior to any water releases.
